Caspoc, A Simulation Experience

Features of CASPOC, A Simulation Experience!
- Replay of the simulation results for failure modes and further investigation. Any point in time can be traced back and the state of the simulation on that point in time can be observed, included the animation, signals and state animation inside hierarchical models
- Animation of the full current path
- Animated symbols on custom library blocks
- Drawing of mechanical system, rotating and translating. Shafts, gearboxes, springs, bearings
- Improved library of electrical machine models
- Easier setting of parameters for all components
- Extended library blocks for power electronics and drive systems
- Interface with Data Acquisition board
- Interface with FEM programs like Integrated-BEM/FEM
- Export of the C code from the control in the block diagram
- Optimized C code export, independent use on any type of microcontroller or DSP
- C code export for the fixed point TI QMATH Library
- Export of Spice netlist from a part of the schematic to perform a detailed spice simulation based on initial conditions calculated in Caspoc.
- Add notes and background bitmaps to your schematic.
- Math blocks for any function evaluation
- Multiplexing signals
- Create scripts to run Caspoc in Batch mode
- Parameter sweep for any component parameter
- Bode diagram for any system to identify stability, impedance and audiosusceptibility. Obtain the Gain/Phase margin, bandwidth for any type of power electronics, no averaging models are required.
- Animation of the contents of the hierarchical library blocks during simulation
- Project management data can be stored with the simulation project
- Archive function to archive the entire project with one click
